

EXPT NO : 2

A python program to implement Simple linear Regression using Least Square Method

DATE:30.08.2024

AIM:

To write a python program to implement Simple linear regression using Least Square Method.

PROCEDURE:

Implementing Simple linear regression using Least Square method using the headbrain dataset involve the following steps:

Step 1: Import Necessary Libraries

First, import the libraries that are essential for data manipulation, visualization, and model building.

```
import pandas as pd

import matplotlib.pyplot as plt import numpy as np
```

Step 2: Load the Iris Dataset

The HeadBrain dataset can be loaded. data =

```
pd.read_csv('/content/headbrain.csv')
```

Step 3: Data Preprocessing

Ensure the data is clean and ready for modeling. Since the Iris dataset is clean, minimal preprocessing is needed.

```
x,y=np.array(list(data['Head Size(cm^3)'])),np.array(list(data['Brain
```

```
Weight(grams) '']))
```

```
print(x[:5],y[:5])
```

OUTPUT :

```
↔ [4512 3738 4261 3777 4177] [1530 1297 1335 1282 1590]
```

Step 4 :Compute the Least Squares Solution

Apply the least squares formula to find the regression coefficients.

```
def get_line(x,y):
```

```
    x_m,y_m = np.mean(x), np.mean(y)
```

```
    print(x_m,y_m)
```

```
    x_d,y_d=x-x_m,y-y_m
```

```
    m = np.sum(x_d*y_d)/np.sum(x_d**2)
```

```
    c = y_m - (m*x_m)
```

```
    print(m, c)
```

```
    return lambda x : m*x+c
```

```
lin=get_line(x,y)
```

OUTPUT :

```
⇒ 3633.9915611814345 1282.873417721519  
0.2634293394893993 325.5734210494428
```

Step 5 : Make Predictions

Use the model to make predictions based on the independent variable.

```
def get_error(line_fuc, x, y):  
  
    y_m = np.mean(y)  
  
    y_pred = np.array([line_fuc(_) for _ in x])  
  
    ss_t = np.sum((y-y_m)**2) ss_r =  
    np.sum((y-y_pred)**2)  
  
    return 1-(ss_r/ss_t) get_error(lin, x,  
y)  
  
from sklearn.linear_model import LinearRegression  
  
x = x.reshape((len(x),1))
```

```
reg=LinearRegression()
```

```
reg=reg.fit(x, y)
```

```
print(reg.score(x, y))
```

OUTPUT :

```
⇒ 1.0
```

```
⇒ 1.0
```

Step 6 :Visualize the Results

Plot the original data points and the fitted regression line.

```
x=np.linspace(np.min(x)-100,np.max(x)+100,1000)
```

```
y=np.array([lin(x) for x in x])
```

```
plt.plot(x, y, color='red', label='Regression line')
```

```
plt.scatter(x, y, color='green', label='Scatter plot') plt.xlabel('Head  
Size(cm^3)')
```

```
plt.ylabel('Brain Weight(grams)') plt.legend() plt.show()
```

OUTPUT :

RESULT:

This step-by-step process will help us to implement least square regression models using the HeadBrain dataset and analyze their performance.
